KBOT FOR KIITIANS

ADITYA MEENA
2005283

Abstract: KBot is an AI interactive agent that receives questions from users, tries to understand the question, and provides appropriate answers. It does this by converting an English sentence into a machine-friendly query, then going through relevant data to find the necessary information, and finally returning the answer in a natural language sentence. In other words, it answers your questions like a human does, instead of giving you the list of websites that may contain the answer.

Individual contribution and findings: I took the responsibility to study the principles of the software development life cycle model and selected the Agile model for the same. I ensured that the team follows the protocols of the Agile model and made them aware of the processes and methods.

Individual contribution to project report preparation: Prepared the documentation for the Agile model.

Individual contribution for project presentation and demonstration:
Explaining the meta information of the Agile model followed in our project.

Full Signature of Supervisor: Full signature of the student
